Deputy Executive Engineer (Electrician) 2026

Gujarat Public Service Commission / Assistant Engineer (Electrical)

Consider the following statements regarding Electric Potential: 1. Electric potential is defined as work done in bringing a unit positive charge from infinity

A

All of the above

B

1 and 3 only

C

2 and 3 only

D

1, 2 and 4 only

Correct

Correct Answer: D

Full Detailed Explanation

Correct Answer: D - 1, 2 and 4 only Quick Concept Explanation The potential difference is path-independent because electrostatic fields are conservative, and electric field is the negative gradient of potential. Equipotential surfaces therefore have no tangential

electric-field component and intersect field lines at right angles. Key relation: $E = -\nabla V$;

$V = -\int E \cdot dl$. Exam focus: Potential is scalar; electric field is vector. Common trap: Do not assign a direction to electric potential. Statement-wise Verification Statement 1 -

Correct. Electric potential is defined as work done in bringing a unit positive charge from infinity to a point. Potential is scalar; electric field is vector. Statement 2 -

Correct. Potential difference between two points is independent of the path taken between them. The potential difference is path-independent because electrostatic fields are conservative, and electric field is the negative gradient of potential. Statement 3 - Incorrect. Electric

potential is a vector quantity since it has magnitude and direction. The correct principle is:

Potential is scalar; electric field is vector. Statement 4 - Correct. Equipotential surfaces are always perpendicular to electric field lines. Equipotential surfaces therefore have no tangential electric-field component and intersect field lines at right angles. Core Concept Electrostatic
